

Datto Inc. - July 21st 2008 - FOR IMMEDIATE RELEASE

Introducing the Z Series

Off site storage company, Datto Inc, released its newest line of backup devices: the Z Series. The new model enables customers to keep snapshots of various stages of their files while simultaneously allowing lightning speed data transfers as a result of the dual gigabit ethernet and 1.5 GHZ processor used within each device.

Z Series Datto devices represent the future of data backup. The new model is the first NAS device targeted at both consumers and small businesses that uses the advanced ZFS file system. This allows users to automatically keep previous versions of their files through snapshots. The snapshots can be programmed to update as frequently as once every fifteen minutes and only use a small amount of disk space while doing so. The ZFS file system also enables the Z Series devices to proactively detect and prevent silent file corruption on the disk drive.

The newest Datto series contains a 1.5 GHZ processor, 1 GB of ram and dual gigabit ethernet jacks in every device, forming a revolutionary new product. The hardware used within the Z Series models represents a cutting edge and fast new way to back up data at an on and off-site location. Because Datto uses an advanced AJAX web interface, it is easy to change the settings of a device. If these features were not enough to win over their customers, Datto additionally offers clients the opportunity to receive a backup model containing two hard drives situated in a mirror configuration. This option, exclusive to the "ZR models," uses dual hard drives for local redundancy and improved performance.

Prior to its launch, Datto offered customers two models of a product designed to provide a reliable and secure method to backing up data in quantities of 100 and 500 Gigabytes. These models, entitled the "Datto Classic" series, effectively ensure all vital information will be duplicated at an off-site location, therefore in the event of natural disaster or theft, all data may be quickly restored using the company's 24 hour policy. The Classic Datto models provide a simple and easy solution to the dilemma of backing up data. The new line brings an innovative approach to data backup. By including new hardware and adding dual gigabit ethernet, the Z Series effectively creates a total and revolutionary solution to keeping an off-site record of all data. Each device has unparalleled flexibility and performance, making it stand out against its competitor products.

In an increasingly digital world, Datto looks forwarding to bringing consumers new options for secure reliable data storage and backup.
